

RADAR[®]

for Film

RADAR is a real workhorse for film applications. Whether it's being used as the recorder for a scoring stage or as a stem recorder for audio post-production, RADAR's fast lock times, ultra-low jitter clocking, and easy workflow integration ensure projects are completed quickly and accurately.

Recording and producing a film's sound makes up a huge part of any film's total production process; it's vital to keep these projects on time and on budget. Let RADAR reduce training and project down time in sound-for-film applications. Here's how:

- RADAR's **RECORD ON CHASE** and **PROJECT PER TAKE** features automate the scoring stage process. Roll back the scene and record it again and again – RADAR is there punching in and out, and automatically creating and labeling new takes and projects.
- **BWAV EXPORT TO DAW**. RADAR records natively to the BWAV format and gives you the option of exporting to a DAW via MADI, Gigabit Ethernet or DVD.
- **SEAMLESS PUNCHES & FILE FLATTENING** make it fast and easy to edit and consolidate overdubs.
- **PROFESSIONAL SYNC**. Get speed and positional referencing from a variety of sync sources including: LTC, MTC, Video Sync, Wordclock, Sony 9-Pin and AES/EBU. LTC can be chased in both forward and reverse directions.
- The **MARK SYNC** feature adds an additional marker to an audio region. This sync marker makes it easy to place sounds and sound effects precisely at spotted timecode locations.
- **SONY 9-PIN MACHINE CONTROL** slip-lock-to-video implementation “glues” audio to the picture for frame-accurate synchronization and virtual instant lock.
- **SOUNDMASTER COMPATIBILITY** allows RADAR to be completely controlled from the Soundmaster ION operating environment.
- **MADI OPTION BOARD** with dual Coax/Optical interface. RADAR is the only recorder on the market with daisy-chainable MADI I/O that presents multiple RADAR units to digital mixing engines as a single, interleaved MADI port.
